

## Week of 7/22/13

Week of: 7/22/13 – 7/25/13

Location: Upper Saranac Lake

Crew Leader: Kyle Jaquis

Divers: Doug Russo  
Chris Critelli

### Monday

Little square bay- Swam the key areas of the tongue finding 64 various sized plants. Some were young single stemmed and others were tall 2-3 stemmed. Continued swimming the north, west and south areas of the bay finding 1/2 of a bag. Moved to the shore between Square Bay and Buck Island finding 32 scattered plants

### Tuesday

Continued into the bay east of Buck Island finding 51 small plants mostly tight to the shoreline on the southern side of the bay. Continued working the north, east, south and part of the western shore of Buck Island finding 3/4 of a bag mostly from the eastern side of the island, although plants were scattered around the entire shore.

### Wednesday

Finished swimming the west side of Buck Island finding another 27 plants mostly young and single stemmed. Moved to the shoreline between Little Square Bay and the bay north of Bottleneck a small patch of 68 mature plants were found. In Bottleneck only 3 plants were found.

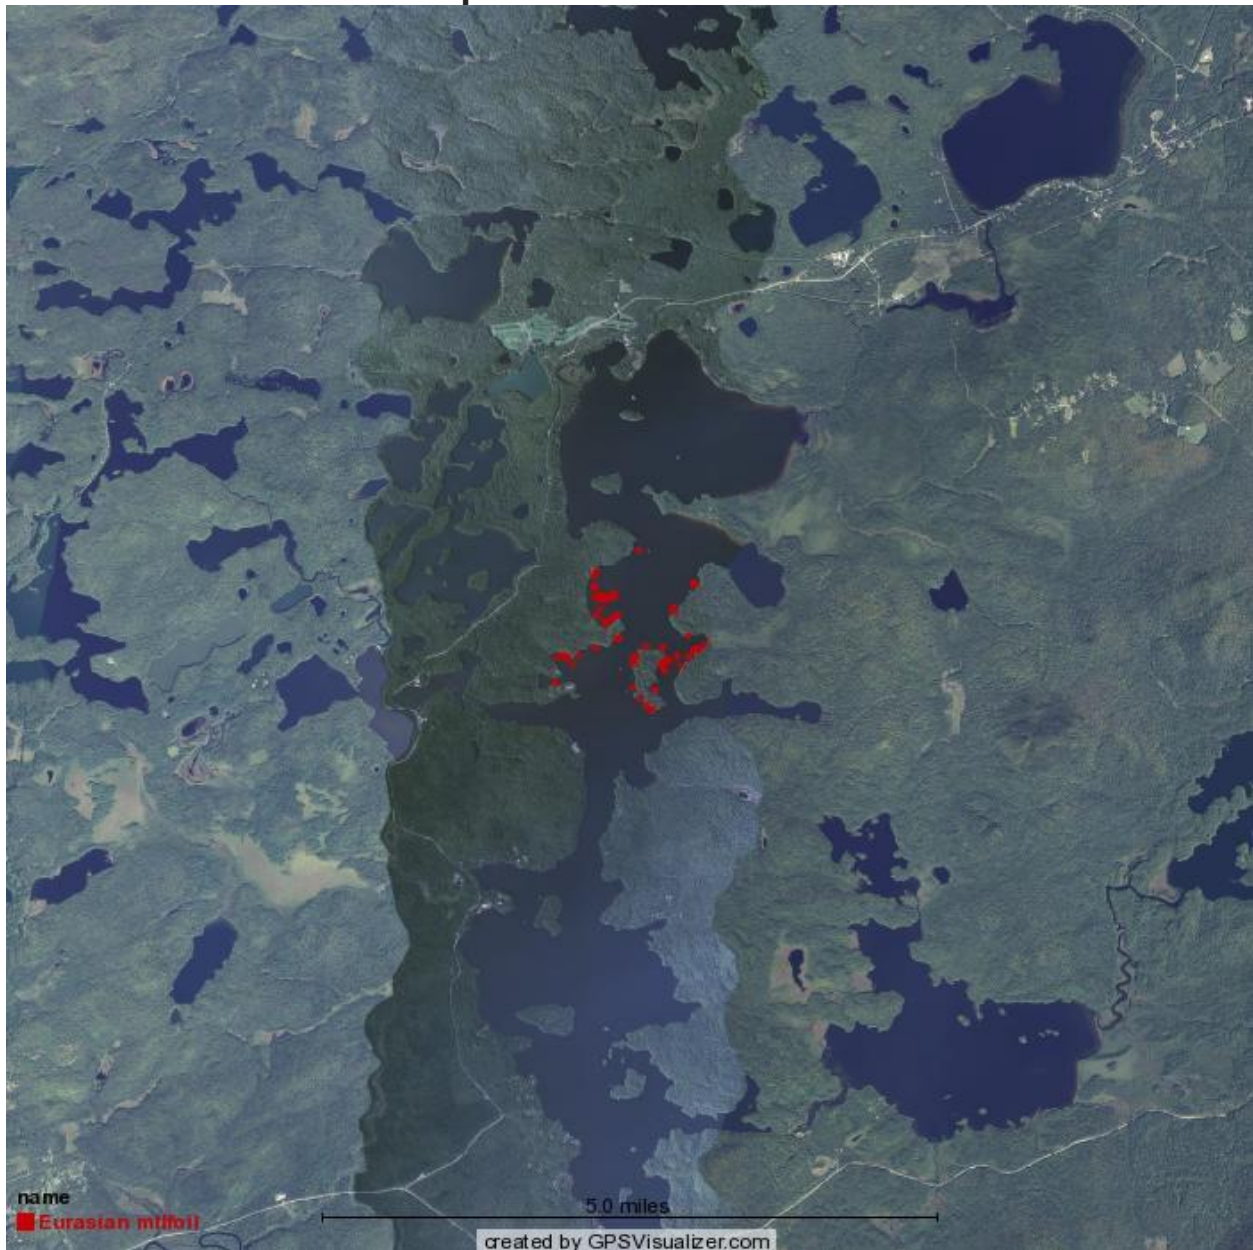

### Thursday

Started swimming the east side of the narrows finding 8 plants and continued around into Pork Bay where only 15 plants were found scattered along the wide littoral zones. Moved to the bay in front of camp Wenonah where 9 plants were found. Relocated to the South side of Saginaw Bay where 70 plants were found mainly in the wider littoral zones near the shallow marker buoys

**Weekly bag count: 1 3/4 bags 43.75 lbs**

**Recommendations:** So far Upper Saranac Lake seems to be in very good shape. All hot spots that have been swam seem to have less and less milfoil. One recommendation I would have is a re-swim of the wide littoral zones in Saginaw Bay.

## Week 10 Total Harvest Map\*

\*These harvest maps are lacking some of the collected waypoints from Saginaw Bay due to some issues with the GPS units. In some cases the waypoint files were corrupted somehow and lost their data.
